
Raised Reflective Pavement Marker - Blue Hydrant

Product Images

Short Description

Raised reflective hydrant marker or 'Cats Eyes' measuring 100 mm x 75 mm. These blue RRPMs come with a reflective strip on both sides and are used for flagging the location of hydrants.

Description

Raised pavement markers (RPMs) or delineators are a safety and visibility device used on roads. These blue reflective markers measure 100 mm x 75 mm and offer excellent visibility to oncoming motorists via the double sided reflective material that reflects car headlights. Blue raised pavement markers are used to note the location of a hydrant. Jaybro also supplies red, white and yellow raised pavement markers. Red pavement markers are used at the side of the road. White markers identify the road is travelling in one direction only, whilst yellow raised pavement markers are usually used to warn motorists that the road is a dual carriageway.

Raised Reflective Pavement Markers or RRPMs are made for durability and high traffic situations. The lightweight plastic construction is strong and highly retroreflective and their raised profile means they can do double duty as a rumble strip for added motorist awareness for lane drifting.

The markers provide highly effective visibility even at night or during rain. Blue hydrant markers or raised pavement markers can be easily fixed to asphalt pavements with a strong adhesive.

We recommend a strong adhesive such as [Megapoxy](#), or alternatively [self-adhesive butyl tar pads](#).
