

Excavation Trench Cover Bridge Handrail Set

Product Images

Short Description

A pair of excavation trench bridge handrails, Designed for use in the civil and construction industry to provide safe passage for pedestrian foot traffic. The handrails measuring 800 mm are suited to Jaybro's range of trench covers.

Description

Trench covers and road plates are widely used during excavation in public areas and allow vehicle and foot traffic to pass safely over trenches. Covering open trenches and pits reduces the risk of accidents and injuries, as open or uncovered pits and trenches can pose a potential safety hazard.

Trench covers are used primarily by communications and utility companies, who routinely work on or near pits that are undergoing maintenance and upgrades. Trench covers can be of use during maintenance, or in the case of missing or damaged pit covers or other civil works. Safe plates and trench covers are deployed to provide safe passage for pedestrians.

Safe plates and trench covers provide protection for both workers and the general public. They reduce the chance of injury from falling or tripping around work zones. Jaybro stock and supply handrail sets to ensure your trench bridge is up to standards. Designed to suit our heavy duty fibreglass trench covers, these handrails are ideal for use in the civil and construction industries.

- Suits 1400mm x 800mm trench cover
- **Handrail only**, [trench cover base plates](#) sold separately
